Historic performance of the CPI and its influence on the value of the Covered Bonds

The general cash-flow of the Covered Bonds is determined in real terms on the Issue Date. The nominal value of each future payment depends on the development of the CPI as demonstrated by the formula in paragraph 15 of Part A of this Final Terms.

Based on data from Statistics Iceland, the year to year inflation, measured as changes in the CPI, has over the last 30 years ranged from -0.04 per cent. in 1994 to 102.8 per cent. in 1982. The average value over the period is 19 per cent. with standard deviation of 21.8 per cent. The same statistic for the last 10 years is an average inflation rate of 4.2 per cent. and standard deviation of 2.2 per cent.

The development of the CPI since 2001 is set out in the table below:

The Central Bank's main objective is price stability, defined as a 12-month rise in the CPI of 2.5 per cent. The aim is to keep the rate of inflation on average as close to the target as possible. If it deviates by more than 1.5

per cent. in either direction, the Central Bank is obliged to present the Icelandic Government with a report, which will be made public, explaining the reasons for the deviation from the target and the Central Bank's responses to the deviation.

The development of 12 month inflation (in percentage terms) since 2001 is set out in the table below:

If policy changes or if the Icelandic economy runs into long-term stagnation it is possible that the level of the CPI will go down over time resulting in individual future payments on the Covered Bonds being lower in nominal terms than the real value of the same payment on the Issue Date.

Information about the CPI can be obtained from the website of Statistics of Iceland being www.hagstofa.is or www.statice.is.
